

Practical-11: High-Fidelity prototyping with animation

1. Create Interactive prototyping with animation and transition on a high-fidelity wireframe screen.

- Use a proper high-fidelity 5-screen that is already designed in practical-10. Make the screen interactive using basic prototyping trigger, action, and animation.
- Make sure to use the right connection and smooth transition between the screens.

Practical-12: Prepare a Full-fledged case study for the Mobile screen

1. Create a case study on any specific system for mobile screens with scrolling.

- Prepare a 3-screen for mobile on any application to make the screen horizontally and vertically scrollable.
- Use Scrolling options in animation and give a smooth transition.

Practical-13: Prepare a Full-fledged case study for the Web screen.

1. Create a case study on any specific system for the Web screen with scrolling.

- Create a full web page home screen that contains horizontal and vertical scrolling.
- Make sure to create a perfect webpage with header, footer, main content with navigation and scrolling.

Practical-14: Design an Animated Navigation Bar

1. Design a navigation bar with animation, ensuring each icon or element can be updated consistently across all screens.

- Design navigation bar for mobile screen with component already created in practical-6.
- Apply the navigation on the component and variants and try its instance on 3 mobile screens and make sure it works with proper animation and navigation across all screens.

Practical-15: Mobile Screen Prototyping Testing

1. Design a Testcase for Prepared Mobile Screen Animation and Prototyping.

- Prototype testing with tests of animations, navigation, and flow for each screen that was already created in practical 11 and practical 12.
- Create a testcase and note down how many heuristic evaluations are followed, check the color combination, and visual hierarchy. Note down any pain points or improvement points that are there.
