

Practical-15: Mobile Screen Prototyping Testing.

Definition: Design a Testcase for Prepared Mobile Screen Animation and Prototyping.

Solution and Working:

- Maze is a remote testing tool that helps in usability testing to see how people interact with designs, prototypes, or websites.
- Steps for Mobile screen prototype testing with the MAZE Testing tool.
- **Step-1: Sign up for Maze (Free)**
 - Go to <https://maze.co/>
 - Click “Get started free”
 - Create a new project and select the testing template or create a new template.
 - Decide on unmoderated (participants test independently) vs. moderated (guided with you present). Unmoderated is easy and scalable.
- **Step-2: Define the Goal for testing**
 - Heuristic evaluation: e.g., visibility of system status, error prevention, etc.
 - Visual design principles: alignment, contrast, hierarchy, visual consistency.
 - Write clear task scenarios like,
 - “Run the testing flow and test the animation”
 - “Find the sign-up form”
 - “Find the contact page and submit a form.”, etc.
- **Step-3: Prepare Your Prototype**
 - Tool: Figma (free for students), Adobe XD, or Sketch.
 - What to include: Screens or flows you want tested (e.g., homepage navigation, form completion, button placements).
- **Step-4: Import Your Prototype**
 - Click “New Project” → “Prototype Test”
 - Get a share link from the Figma file of your design and click on share, and copy the link with “Anyone” viewing access.
 - Connect your Figma prototype and paste the link to import the prototype.

- Select the screens you want to test.
- **Step-5: Add Testing Questions Blocks**
 - Maze supports multiple-choice, rating, or open text questions.
 - Add them after tasks to get feedback. Examples:
 - Heuristic evaluation prompts:
 - “Was it clear where to go next? (Yes/No)”
 - “Did you feel confused at any step? (Open text)”
 - “The design felt consistent across screens.” (Consistency)
 - Visual design principle prompts:
 - “Which element gains your attention first? (Open text)”
 - “Was the text easy to read? (Yes/No)”
 - “Test the animation flow properly, does it work well or not? (Yes/No)”
- **Step-6: Preview and Live the Test**
 - Preview your maze to ensure everything flows correctly before launching.
 - Publish (Go Live) and share the Maze link.
 - Let users complete tasks independently.
- **Step-7: Collect & Analyze Results**
 - Maze provides:
 - Heatmaps: see where clicks happen.
 - Misclick percentages and time spent per screen.
 - Task completion rates, success scores, and average completion times
- **Step-8: Create a Usability Report and Iterate**
 - Go to the Reports tab → Maze generates charts and summaries.
 - It will give quantitative + qualitative data according to test blocks.
 - Export to PDF or screenshot graphs.
 - Iterate & Retest: Update the design and test again to confirm fixes.
